Introduction

This guideline provides a description and technical layout of the data segments recommended for use by a carrier when sending EDI loading and/or routing guides (ASC X12 transaction set 217).

The ASC X12 version presented in this guideline is 003050. If you cannot send routing guides in 003050 or have other data requirements not contained in this guideline, please consult your 3M EDI contact.

This transaction must include all terminals, terminal to terminal transit time, points served, and the service standards (transit times) between terminals and points served. We require that you accurately define those points which are serviced direct or with an interline by using the respective service descriptions found in the SV segment. If a point is served by multiple terminals, transmit the terminal (routing) used most often.

An example of a routing guide and its ASC X12 interpretation can be found at the back of this guideline.

Note: For illustration purposes only, all examples use an asterisk (*) as the data element separator and a caret (^) as the data element segment terminator. In actual practice, values must be chosen that do not conflict with the data.

Functional Group ID=FG

Introduction:

This Draft Standard for Trial Use contains the format and establishes the data contents of the Motor Carrier Loading and Route Guide Transaction Set (217) for use within the context of an Electronic Data Interchange (EDI) environment. The transaction set can be used to provide interested parties with a motor carrier's loading instructions and/or routing guide. A transmission may include a list of the motor carrier's terminals, a list of all points served, or a matrix of all points served showing the advertised service times. The motor carrier may also indicate its breakbulk terminal(s) to be used for each point for loading purposes.

Transaction Set Notes

- 1. Loop 0100 provides detailed information relative to freight terminals.
- 2. The value of DE 447 in the LS and LE segments shall be the loop ID of 0200.
- 3. Loop 0200 provides the service matrix between freight terminals or locations.
- **4.** The value of DE 447 in the LS and LE segments shall be the loop ID of 0200.
- **5.** Loop 0300 provides the service points list and associated information.

Segment: ST Transaction Set Header

Position: 010

Loop:

Level: Heading Usage: Mandatory

Max Use: 1

Purpose:

To indicate the start of a transaction set and to assign a control number

Syntax Notes:

Semantic Notes:

1 The transaction set identifier (ST01) is used by the translation routines of the interchange partners to select the appropriate transaction set definition (e.g., 810 selects the Invoice Transaction Set).

Comments:

Notes: 3M Example(s): ST*217*000000514^

			Sender-assigned sequential control number to mat	ch control number on

Segment: BLR Transportation Carrier Identification

Position: 020

Loop:

Level: Heading Usage: Mandatory

Max Use: 1

Purpose: To transmit the identifying SCAC code and effective date for the data in the

transaction set

Syntax Notes:

Semantic Notes: 1 BLR02 is the effective date of the data in this transaction set.

Comments:

Notes: 3M Example(s): BLR*HYMF*000103^

Data Element Summary

Ref. Data Element Name Des. **Attributes** Required Standard Carrier Alpha Code M ID 2/4 BLR01 140 Standard Carrier Alpha Code Required 373 Date O DT 6/6 BLR02

Date (YYMMDD)

Effective date for the data contained in this transaction set.

Segment: N1 Name

Position: 030

Loop: 0100 Optional

Level: Heading Usage: Optional Max Use: 1

Purpose: To identify a party by type of organization, name, and code

Syntax Notes: 1 At least one of N102 or N103 is required.

2 If either N103 or N104 is present, then the other is required.

Semantic Notes:

Comments: 1 This segment, used alone, provides the most efficient method of providing

organizational identification. To obtain this efficiency the "ID Code" (N104) must provide a key to the table maintained by the transaction processing party.

N105 and N106 further define the type of entity in N101.

Notes: 3M Comments: Loop 0100 is used to indicate a carrier's terminal code, address,

and contact for all terminals referenced in loops 0200 and 0300.

The Identification Code in element N104 should be unique to assure that it can be a

key (non-repeating) when 3M processes the data from a carrier.

3M Example(s): N1*TR**93*CIN^

Required	Ref. <u>Des.</u> N101	Data <u>Element</u> 98	<u>Name</u> Entity Identifier C	Code		ributes ID 2/2

			Address information	

Segment: N4 Geographic Location

Position: 050

Loop: 0100 Optional

Level: Heading Usage: Optional

Max Use: 1

Purpose: To specify the geographic place of the named party
Syntax Notes: 1 If N406 is present, then N405 is required.

Semantic Notes:

Comments: 1 A combination of either N401 through N404, or N405 and N406 may be

adequate to specify a location.

2 N402 is required only if city name (N401) is in the USA or Canada.

Notes: 3M Comments: Loop 0100 is used to indicate a carrier's terminal code, address,

and contact for all terminals referenced in loops 0200 and 0300.

3M Example(s): N4*CINCINNATI*OH*45216^

	Ref.	Data			
	Des.	Element	<u>Name</u>	Att	<u>ributes</u>
Required	N401	19	City Name	O	AN 2/30
			Free-form text for city name		
Required	N402	156	State or Province Code	0	ID 2/2
			Code (Standard State/Province) as defined by appropriate goagency	overn	ment
Required	N403	116	Postal Code	0	ID 3/11
			Code defining international postal zone code excluding pund blanks (zip code for United States)	ctuati	on and
	N404	26	Country Code	0	ID 2/3
			Code identifying the country		
			Used only if address is outside the U.S.		

Segment: G61 Contact

Position: 070

Loop: 0100 Optional

Level: Heading Usage: Optional

Max Use: 1

Purpose: To identify a person or office to whom communications should be directed

Syntax Notes: 1 If either G6103 or G6104 is present, then the other is required.

Semantic Notes:

Comments: 1 G6103 qualifies G6104.

Notes: 3M Comments: Loop 0100 is used to indicate a carrier's terminal code, address,

and contact for all terminals referenced in loops 0200 and 0300.

3M Example(s): G61*MG*ART KRESS*TE*5136791111^

	Ref.	Data	Data Element Summary		
	Des.	Element	<u>Name</u>	Att	<u>ributes</u>

Segment: LS Loop Header

Position: 010

Loop:

Level: Detail
Usage: Optional

Max Use: 1

Purpose: To indicate that the next segment begins a loop

Syntax Notes:

Semantic Notes:

One loop may be nested contained within another loop, provided the inner nested loop terminates before the outer loop. When specified by the standard setting body as mandatory, this segment in combination with "LE", must be used. It is not to be used if not specifically set forth for use. The loop identifier in the loop header and trailer must be identical. The value for the identifier is the loop ID of the required loop segment. The loop ID number is given on the transaction set diagram in the appropriate ASC X12 version/release.

Comments:

1 See Figures Appendix for an explanation of the use of the LS and LE segments.

Notes: 3M Comments: Required by 3M

Loop 0200 is used to indicate the terminals and the service standard (transit times)

between those terminals.

3M Example(s): LS*0200^

Data Element Summary

Number assigned for differentiation within a transaction set

Segment: N1 Name

Position: 060

Loop: 0210 Optional

Level: Detail
Usage: Optional

Max Use: 3

Purpose: To identify a party by type of organization, name, and code

Syntax Notes: 1 At least one of N102 or N103 is required.

2 If either N103 or N104 is present, then the other is required.

Semantic Notes:

Comments:

- 1 This segment, used alone, provides the most efficient method of providing organizational identification. To obtain this efficiency the "ID Code" (N104) must provide a key to the table maintained by the transaction processing party.
- 2 N105 and N106 further define the type of entity in N101.

Notes:

3M Comments: Required by 3M

The order of Entity Identity Code (element N101) transmitted in N101 must follow this order:

- 1. FB (if available)
- 2. LB (if available)
- 3. DT (always)

If no break terminal exists, only include the destination terminal identified as DT.

If one (1) break terminal exists, the break terminal identified as the FB and the destination terminal should be identified as DT.

If two (2) break terminals exist, the first break terminal transmitted is identified as FB, followed by the next break terminal identified as LB, and finally the destination terminal identified as DT.

If more than two (2) break terminals exist, the first terminal sent is identified as FB. The next break terminal transmitted is the last break terminal before the destination terminal, identified as LB. The final record transmitted is the destination terminal, identified as DT. Data for any other break terminals is not needed.

The Identification Code in element N104 should be unique to assure that it can be a key (non-repeating) when 3M processes the data from a carrier.

3M Example(s): N1*DT**93*MLW^

The service time between any two points is determined by adding (summing) the respective service times for the following:

- Origin service area to origin terminal (Table 2)
- Origin terminal to destination terminal (Table 1)
- Destination terminal to destination service area (Table 2).
