Wal-Mart Stores, Inc. Introduction to the 856 Ship Notice/Manifest Transaction Set

Wal-Mart complies with the Retail Industry Conventions as published in the Voluntary Inter-Industry Communications Standard (VICS) for the 856 Ship Notice/Manifest transaction set. This document contains specifications and recommendations for inclusion of specific data elements supported by the VICS standard. Wal-Mart computer applications use the data elements in this document to manage the transportation, distribution, and receiving of your products for our stores or distribution centers. Other information sent in 856 segments may be sent, but will not be read into the system, and will not cause an error condition. This will enable you to send similar 856 documents to other retailers and not have to do extensive customization to meet Wal-Mart's specifications. Data elements and segments that are required by Wal-Mart applications are noted as required in this implementation guideline.

A *Functional Acknowledgment*, VICS/EDI transaction set 997, will be sent within 24 hours to acknowledge EDI compliance of your 856 document. If your transaction is not compliant and you receive a rejected acknowledgment, you must correct the issue and re-send your transaction as soon as possible.

If there are omissions or if errors in the data are detected by our receiving or traffic applications, an *Application Advice* VICS/EDI 824 transaction set will be sent to you. A separate implementation guide for the 824 document may be found on Retail Link. If you receive an 824, please correct and resend the data within 24 hours.

The purpose of the 856 is to enable vendors to notify Wal-Mart that merchandise for a specific purchase order has been shipped. The transaction set contains data about the vendor's shipment, the original Wal-Mart order, and identifies the differences in order quantities or substitutions shipped against the purchase order. It also contains information used to track the items shipped at the carton level. This carton "license plate" is the UCC-128 Serial Shipping Container Code. Use of the UCC-128 barcode on cartons and pallets expedites the receiving of merchandise at the Wal-Mart business units (distribution centers, stores and clubs) enabling rapid verification of receipt and expeditious payment to the vendors.

Two items related to ASN's are considered to be critical success factors resulting in your successful implementation of the 856 Ship Notice/Manifest document. Those are:

- Accuracy You must strive to ensure that the data you send us will be 100% accurate, 100% of the time. Data that is 99% accurate provides no benefit for either of us. One of the most common actions that prevents 100% accuracy is attempting to create the 856 from data showing what has been picked, rather than generating it from what was actually shipped.
- **Timing** In order to be of any benefit, the data must arrive at the Wal-Mart receiving point before the merchandise. Several things must happen between the moment the delivery truck departs from your shipping dock and the time it arrives at our receiving dock. You must collect the shipment data, transform it into an 856 and communicate the data to Wal-Mart. Our systems will process this data in an event-driven architecture to process the information, validate it and deliver it to the receiving point without delay.

Validation

The following is a condensed list of items which are validated in Wal-Mart application systems. Correct transmission of this information will speed the processing and improve the benefits of the Advanced Ship Notice for DSDC and Store shipments.

- Document Structure (HL Sequence and Parentage)
- Ship-to Location must be a valid business unit
- Purchase Order Number (for non-DSD orders)
- Purchase Order Date (for non-DSD orders)
- Vendor Number (the Wal-Mart 9-digit vendor number is required)
- Mark-for must be a valid business unit
- Vendor must be authorized by the Buyer to submit ASN's and testing approved by EDI Supplier Support Desk.
- Item/UPC Numbers (Item/UPC numbers must be valid)

Any code from the VICS Code Definitions and Code Lists will be read by our application, but only those contained in this document will be acted upon by our applications.

Your compliance is strongly encouraged to permit Wal-Mart to readily receive and pay you for the merchandise you ship and increase the productivity of the entire distribution chain. Use of the 856 and UCC-128 barcode will enable in-stock percentages and should result in increased sales of your product. We appreciate you as a supplier or trading partner and solicit your support in helping get your product to the market.

Business Changes

To support our growing company, Wal-Mart Stores, Inc. will be incorporating the following business changes into this 5010 upgrade.

Wal-Mart will utilize the GTIN (Global Traded Item Number) in EDI X12 Version 5010. GTIN information will be sent in addition to the Item/UPC code. It will be the suppliers' responsibility to handle the information as their systems become GTIN compliant. For more information regarding GTIN, please visit the UCC website or the appropriate numbering organization.

How to contact EDI Supplier Support

For answers to any questions regarding this Implementation Guide, contact EDI Supplier Support at (479) 273-8888. You will need to select the option for the Traffic Logistics Team. Questions can also be submitted to EDI Supplier Support via email at edi@wal-mart.com. (Please include your Supplier Number on all emails).

856 Ship Notice/Manifest – Glossary of Terms

Truckload Shipment (TRK)

A truckload shipment has one supplier's ship notice associated with the entire truck's merchandise.

Less-Than Truckload Shipment (LTL)

Less-than truckload shipments can have more than one supplier's ship notices associated with an entire truck. Consolidators may be used to combine less-than truckload shipments. This information is not required on the ship notice.

Small Package Shipment (SMP)

Small package shipments are parcel carriers that ship small packages directly to a shipping location. There is usually a ship notice assigned to each package, or there can be several small packages bound together with one ship notice. See the VICS Introduction in the Appendix for more information on small package shipments.

Cross-dock (DSDC)

A cross-dock shipment is merchandise sent to the distribution center that has been pre-labeled and packaged for individual stores. Within the ship notice, the distribution center must be defined at shipment level in the N1 segment with the "ST" qualifier. You must define the individual stores at the order level in the N1 segment with a "BY" qualifier.

Non-Cross-dock (Non-DSDC)

A shipment not defined as cross-dock is merchandise that is sent directly to the distribution center. This merchandise does not contain an ultimate location on the label, but is shipped to the stores at the discretion of the recipient (e.g., replenishment orders). Within the ship notice, the distribution center must be defined at shipment level in the N1 segment with "ST" qualifier. Although not required, you may send the N1 segment with the "BY" qualifier at order level containing the distribution center information. When the additional N1 segment with the "BY" qualifier is sent at order level, the information contained in the segment MUST match the information contained in the N1 segment with the "ST" qualifier.

Direct to Store

If the supplier receives orders to be shipped directly to the store, the ship notices must be sent to Wal-Mart so that merchandise can be received at the store. Within the ship notice, the store must be defined at the shipment level in the N1 segment with the "ST" qualifier. Although not required, you may send the N1 segment with the "BY" qualifier at order level containing the store information. When the additional N1 segment with the "BY" qualifier is sent at order level, the information contained in the segment MUST match the information contained in the N1 segment with the "ST" qualifier.

Markings

Markings are a way to uniquely identify a package to be received. For additional information concerning the Wal-Mart carton marking guidelines, please refer to your Supplier Information Manual. For a copy of the Supplier Information Manual, visit the Retail Link web site at https://retaillink.wal-mart.com. From the main page select the *Information* section. Under *Reference*, select *Vendor Guides* then *Supplier Information Manual*. Carton Marking information can be found in section 4.

Segment: ST Transaction Set Header

Position: 0100

Loop:

Level: Heading Usage: Mandatory

Max Use: 1

Purpose: Syntax Notes:

Semantic Notes:

To indicate the start of a transaction set and to assign a control number

1 The transaction set identifier (ST01) is used by the translation routines of the interchange partners to select the appropriate transaction set definition (e.g., 810 selects the Invoice Transaction Set).

2 The implementation convention reference (ST03) is used by the translation routines of the interchange partners to select the appropriate implementation convention to match the transaction set definition. When used, this implementation convention reference takes precedence over the implementation reference specified in the GS08.

Comments:

Segment: HL Hierarchical Level [Shipment]

Position: 0100
Loop: HL
Level: Detail
Usage: Mandatory

Max Use:

Purpose: To identify dependencies among and the content of hierarchically related groups of data

segments

Syntax Notes: Semantic Notes: Comments:

1 The HL segment is used to identify levels of detail information using a hierarchical structure, such as relating line-item data to shipment data, and packaging data to lineitem data.

The HL segment defines a top-down/left-right ordered structure.

- 2 HL01 shall contain a unique alphanumeric number for each occurrence of the HL segment in the transaction set. For example, HL01 could be used to indicate the number of occurrences of the HL segment, in which case the value of HL01 would be "1" for the initial HL segment and would be incremented by one in each subsequent HL segment within the transaction.
- 3 HL02 identifies the hierarchical ID number of the HL segment to which the current HL segment is subordinate.
- 4 HL03 indicates the context of the series of segments following the current HL segment up to the next occurrence of an HL segment in the transaction. For example, HL03 is used to indicate that subsequent segments in the HL loop form a logical grouping of data referring to shipment, order, or item-level information.
- 5 HL04 indicates whether or not there are subordinate (or child) HL segments related to the current HL segment.

Notes:

D.f

Data

The HL segment is used to identify levels of detail information using a hierarchical structure.

HL01 shall contain a unique number for each occurrence of the HL segment within the transaction set. The value assigned to the first HL segment will be 1, and is incremented by one for each subsequent HL segment within the transaction set.

HL02 identifies the hierarchical ID of the HL segment to which it is subordinate (child of). HL02 will be omitted for the first occurrence of the HL segment in the transaction set, since it has no parent. HL03 identifies the application content of the series of segments following the current HL segment up to the next occurrence of an HL segment, or the CTT or SE segment, e.g., Shipment, Unit Load, Order, Tare, Pack and Item.

	Ref.	Data

TD5 Carrier Details (Routing Sequence/Transit Time) **Segment:**

Position: 1200 HLLoop: Level: Detail Usage: **Optional** Max Use: 12

Purpose: To specify the carrier and sequence of routing and provide transit time information

At least one of TD502 TD504 TD505 TD506 or TD512 is required. **Syntax Notes:**

If TD502 is present, then TD503 is required.

3 If TD507 is present, then TD508 is required.

4 If TD510 is present, then TD511 is required. 5 If TD513 is present, then TD512 is required.

6 If TD514 is present, then TD513 is required.

7 If TD515 is present, then TD512 is required.

Semantic Notes: Comments: 1 TD515 is the country where the service is to be performed.

When specifying a routing sequence to be used for the shipment movement in lieu of 1 specifying each carrier within the movement, use TD502 to identify the party responsible for defining the routing sequence, and use TD503 to identify the actual routing sequence, specified by the party identified in TD502.

Notes:

This segment is used to specify every carrier in the routing sequence or a specific routing sequence that has been previously identified (usually from a routing guide). The segment can also be used to indicate estimated transit time in days. Only use TD501 if needed for clarity; this is not a requirement in most retail applications. When referring to a pre-established routing guide, use code 91 or 92 in TD502 and identify the routing sequence, from the routing guide, in TD503. To identify a specific private parcel service, TD502 will contain code 2 and TD503 will contain the corresponding SCAC. TD510 and TD511 are used to specify transit time.

When using a small package service provider as the carrier, TD502 will contain code 2, TD503 will contain the carrier's SCAC, and TD504 will contain code U to inform the receiver of a small package service shipment. This segment is required by Wal-Mart Stores, Inc.

MAN Marks and Numbers Information **Segment:**

1900 **Position:** Loop: HLLevel: Detail Usage: **Optional** Max Use: >1

Notes:

Purpose: To indicate identifying marks and numbers for shipping containers If either MAN04 or MAN05 is present, then the other is required. **Syntax Notes:**

If MAN06 is present, then MAN05 is required.

Semantic Notes:

MAN01/MAN02 and MAN04/MAN05 may be used to identify two different marks and numbers assigned to the same physical container.

When both MAN02 and MAN03 are used, MAN02 is the starting number of a sequential range and MAN03 is the ending number of that range.

3 When both MAN05 and MAN06 are used, MAN05 is the starting number of a sequential range, and MAN06 is the ending number of that range.

Comments: When MAN01 contains code "UC" (U.P.C. Shipping Container Code) and 1

> MAN05/MAN06 contain a range of ID numbers, MAN03 is not used. The reason for this is that the U.P.C. Shipping Container code is the same on every carton that is represented in the range in MAN05/MAN06.

MAN03 and/or MAN06 are only used when sending a range(s) of ID numbers. When both MAN02/MAN03 and MAN05/MAN06 are used to send ranges of ID numbers, the integrity of the two ID numbers must be maintained.

This segment, at the shipment level, is used to specify a single UCC/EAN-128 Serial Shipping Container Code (SSCC-18) to identify an entire shipment (full trailer).

Segment: N1 Party Identification

Position: 2200 Loop: HL-N1 Level: Detail Usage: Optional Max Use: 1

Purpose: To identify a party by type of organization, name, and code

Syntax Notes: 1 At least one of N102 or N103 is required.

If either N103 or N104 is present, then the other is required.

Semantic Notes: Comments:

1 This segment, used alone, provides the most efficient method of providing organizational identification. To obtain this efficiency the "ID Code" (N104) must provide a key to the table maintained by the transaction processing party.

N105 and N106 further define the type of entity in N101.

Notes: Wal-Mart uses the data in this segment loop to determine where to route the Ship Notice data so that receiving may be accomplished in an efficient manner. This is

the "ship-to" of the entire shipment.

For a cross-dock shipment, this will define the warehouse or distribution center the goods are being shipped to. The N1*BY in the order hierarchical level will contain the store breakout. When defining more than one store, the order level, containing its own unique pack and item levels, must be repeated for each store within the cross-dock order.

This segment is required by Wal-Mart Stores, Inc.

Segment: HL Hierarchical Level [Order]

Position: 0100
Loop: HL
Level: Detail
Usage: Mandatory

Max Use:

Purpose: To identify dependencies among and the content of hierarchically related groups of data

segments

Syntax Notes: Semantic Notes: Comments:

1 The HL segment is used to identify levels of detail information using a hierarchical structure, such as relating line-item data to shipment data, and packaging data to lineitem data.

The HL segment defines a top-down/left-right ordered structure.

- 2 HL01 shall contain a unique alphanumeric number for each occurrence of the HL segment in the transaction set. For example, HL01 could be used to indicate the number of occurrences of the HL segment, in which case the value of HL01 would be "1" for the initial HL segment and would be incremented by one in each subsequent HL segment within the transaction.
- 3 HL02 identifies the hierarchical ID number of the HL segment to which the current HL segment is subordinate.
- 4 HL03 indicates the context of the series of segments following the current HL segment up to the next occurrence of an HL segment in the transaction. For example, HL03 is used to indicate that subsequent segments in the HL loop form a logical grouping of data referring to shipment, order, or item-level information.
- 5 HL04 indicates whether or not there are subordinate (or child) HL segments related to the current HL segment.

Notes:

The HL segment is used to identify levels of detail information using a hierarchical structure.

HL01 shall contain a unique number for each occurrence of the HL segment within the transaction set. The value assigned to the first HL segment will be 1, and is incremented by one for each subsequent HL segment within the transaction set.

HL02 identifies the hierarchical ID of the HL segment to which it is subordinate (child of). HL02 will be omitted for the first occurrence of the HL segment in the transaction set, since it has no parent. HL03 identifies the application content of the series of segments following the current HL segment up to the next occurrence of an HL segment, or the CTT or SE segment, e.g., Shipment, Unit Load, Order, Tare, Pack and Item.

Segment: PRF Purchase Order Reference

Position: 0500
Loop: HL
Level: Detail
Usage: Optional
Max Use: 1

Purpose:

To provide reference to a specific purchase order

Syntax Notes:

Semantic Notes:

1 PRF04 is the date assigned by the purchaser to purchase order.

Comments: Notes:

Please note that the Max Usage of this segment is 1. Only a single PO Number may be communicated within an Order level-HL segment loop. If you have more than one PO in the shipment then you will have one Order level HL segment loop for each PO. DSD Suppliers can put *NO PO* or other 10-digit number.

This segment is required by Wal-Mart Stores, Inc.

Segment: N1 Party Identification

Position: 2200
Loop: HL-N1
Level: Detail
Usage: Optional
Max Use: 1

Purpose: To identify a party by type of organization, name, and code

Syntax Notes: 1 At least one of N102 or N103 is required.

If either N103 or N104 is present, then the other is required.

Semantic Notes: Comments:

1 This segment, used alone, provides the most efficient method of providing organizational identification. To obtain this efficiency the "ID Code" (N104) must provide a key to the table maintained by the transaction processing party.

N105 and N106 further define the type of entity in N101.

Notes: <u>In a distribution center cross-dock receiving environment, this segment loop will</u> identify the store for which the merchandise has been packaged and to which the

transport container has been addressed.

See note on the N1*ST for more information regarding cross-dock shipments.

This segment is required for Wal-Mart Stores, Inc.

Segment: HL Hierarchical Level [Tare]

Position: 0100
Loop: HL
Level: Detail
Usage: Mandatory

Max Use:

Purpose: To identify dependencies among and the content of hierarchically related groups of data

segments

Syntax Notes: Semantic Notes: Comments:

1 The HL segment is used to identify levels of detail information using a hierarchical structure, such as relating line-item data to shipment data, and packaging data to line-item data.

The HL segment defines a top-down/left-right ordered structure.

- 2 HL01 shall contain a unique alphanumeric number for each occurrence of the HL segment in the transaction set. For example, HL01 could be used to indicate the number of occurrences of the HL segment, in which case the value of HL01 would be "1" for the initial HL segment and would be incremented by one in each subsequent HL segment within the transaction.
- 3 HL02 identifies the hierarchical ID number of the HL segment to which the current HL segment is subordinate.
- 4 HL03 indicates the context of the series of segments following the current HL segment up to the next occurrence of an HL segment in the transaction. For example, HL03 is used to indicate that subsequent segments in the HL loop form a logical grouping of data referring to shipment, order, or item-level information.
- 5 HL04 indicates whether or not there are subordinate (or child) HL segments related to the current HL segment.

Notes:

The HL segment is used to identify levels of detail information using a hierarchical structure.

HL01 shall contain a unique number for each occurrence of the HL segment within the transaction set. The value assigned to the first HL segment will be 1, and is incremented by one for each subsequent HL segment within the transaction set.

HL02 identifies the hierarchical ID of the HL segment to which it is subordinate (child of). HL02 will be omitted for the first occurrence of the HL segment in the transaction set, since it has no parent. HL03 identifies the application content of the series of segments following the current HL segment up to the next occurrence of an HL segment, or the CTT or SE segment, e.g., Shipment, Unit Load, Order, Tare, Pack and Item.

Shipping Tare Level is optional for DSDC and DSD ASN types.

MAN Marks and Numbers Information **Segment:**

1900 **Position:** Loop: HLLevel: Detail Usage: **Optional** Max Use: >1

Comments:

Notes:

Purpose: To indicate identifying marks and numbers for shipping containers If either MAN04 or MAN05 is present, then the other is required. **Syntax Notes:**

If MAN06 is present, then MAN05 is required. **Semantic Notes:**

MAN01/MAN02 and MAN04/MAN05 may be used to identify two different marks and numbers assigned to the same physical container.

When both MAN02 and MAN03 are used, MAN02 is the starting number of a sequential range and MAN03 is the ending number of that range.

3 When both MAN05 and MAN06 are used, MAN05 is the starting number of a sequential range, and MAN06 is the ending number of that range.

When MAN01 contains code "UC" (U.P.C. Shipping Container Code) and 1 MAN05/MAN06 contain a range of ID numbers, MAN03 is not used. The reason for this is that the U.P.C. Shipping Container code is the same on every carton that is represented in the range in MAN05/MAN06.

MAN03 and/or MAN06 are only used when sending a range(s) of ID numbers. When both MAN02/MAN03 and MAN05/MAN06 are used to send ranges of ID numbers, the integrity of the two ID numbers must be maintained.

This segment, at the tare level, is used to specify the identification numbers for the pallet.

Segment: MAN Marks and Numbers Information

Position: 1900
Loop: HL
Level: Detail
Usage: Optional
Max Use: >1

Purpose: To indicate identifying marks and numbers for shipping containers
Syntax Notes: 1 If either MAN04 or MAN05 is present, then the other is required.

If MAN06 is present, then MAN05 is required.

Semantic Notes: 1 MAN01/MAN02 and MAN04/MAN05 may be used to identify two different marks

and numbers assigned to the same physical container.

2 When both MAN02 and MAN03 are used, MAN02 is the starting number of a sequential range and MAN03 is the ending number of that range.

3 When both MAN05 and MAN06 are used, MAN05 is the starting number of a

sequential range, and MAN06 is the ending number of that range.

Comments: 1 When MAN01 contains code "UC" (U.P.C. Shipping Container Code) and

MAN05/MAN06 contain a range of ID numbers, MAN03 is not used. The reason for this is that the U.P.C. Shipping Container code is the same on every carton that is represented in the range in MAN05/MAN06.

2 MAN03 and/or MAN06 are only used when sending a range(s) of ID numbers. When both MAN02/MAN03 and MAN05/MAN06 are used to send ranges of ID numbers, the integrity of the two ID numbers must be maintained.

Segment: PAL Pallet Type and Load Characteristics

Position: 2150
Loop: HL
Level: Detail
Usage: Optional
Max Use: 1

Purpose: To identify the type and physical attributes of the pallet, and, gross weight, gross volume,

and height of the load and the pallet

Syntax Notes: 1 If either PAL05 or PAL06 is present, then the other is required.

2 If PAL07 is present, then PAL10 is required.
3 If PAL08 is present, then PAL10 is required.
4 If PAL09 is present, then PAL10 is required.

5 If PAL10 is present, then at least one of PAL07 PAL08 or PAL09 is required.

6 If either PAL11 or PAL12 is present, then the other is required.

7 If either PAL13 or PAL14 is present, then the other is required.

Semantic Notes: 1 PAL04 (Pack) is the number of pieces on the pallet.

2 PAL05 (Unit Weight) is the weight of the pallet alone, before loading.

3 PAL07 and PAL08 (Length and Width) are the dimensions of the pallet before loading.

4 PAL09 (Height) is the height of the pallet and load.

5 PAL11 and PAL13 (Gross Weight and Gross Volume) are measured after loading and includes the pallet.

HL Hierarchical Level [Pack] **Segment:**

0100 **Position:** HLLoop: Level: Detail Usage: Mandatory

Max Use:

Purpose: To identify dependencies among and the content of hierarchically related groups of data

segments

Syntax Notes: Semantic Notes: Comments:

The HL segment is used to identify levels of detail information using a hierarchical structure, such as relating line-item data to shipment data, and packaging data to lineitem data.

The HL segment defines a top-down/left-right ordered structure.

- HL01 shall contain a unique alphanumeric number for each occurrence of the HL segment in the transaction set. For example, HL01 could be used to indicate the number of occurrences of the HL segment, in which case the value of HL01 would be "1" for the initial HL segment and would be incremented by one in each subsequent HL segment within the transaction.
- HL02 identifies the hierarchical ID number of the HL segment to which the current HL segment is subordinate.
- HL03 indicates the context of the series of segments following the current HL segment up to the next occurrence of an HL segment in the transaction. For example, HL03 is used to indicate that subsequent segments in the HL loop form a logical grouping of data referring to shipment, order, or item-level information.
- HL04 indicates whether or not there are subordinate (or child) HL segments related to the current HL segment.

Notes:

The HL segment is used to identify levels of detail information using a hierarchical structure.

HL01 shall contain a unique number for each occurrence of the HL segment within the transaction set. The value assigned to the first HL segment will be 1, and is incremented by one for each subsequent HL segment within the transaction set.

HL02 identifies the hierarchical ID of the HL segment to which it is subordinate (child of). HL02 will be omitted for the first occurrence of the HL segment in the transaction set, since it has no parent. HL03 identifies the application content of the series of segments following the current HL segment up to the next occurrence of an HL segment, or the CTT or SE segment, e.g., Shipment, Unit Load, Order, Tare, Pack and Item.

MAN Marks and Numbers Information **Segment:**

Position: 1900 HLLoop: Level: Detail Usage: **Optional** Max Use: >1

Notes:

Purpose: To indicate identifying marks and numbers for shipping containers **Syntax Notes:**

If either MAN04 or MAN05 is present, then the other is required.

If MAN06 is present, then MAN05 is required.

Semantic Notes: MAN01/MAN02 and MAN04/MAN05 may be used to identify two different marks and numbers assigned to the same physical container.

> When both MAN02 and MAN03 are used, MAN02 is the starting number of a sequential range and MAN03 is the ending number of that range.

> 3 When both MAN05 and MAN06 are used, MAN05 is the starting number of a sequential range, and MAN06 is the ending number of that range.

Comments: When MAN01 contains code "UC" (U.P.C. Shipping Container Code) and 1

MAN05/MAN06 contain a range of ID numbers, MAN03 is not used. The reason for this is that the U.P.C. Shipping Container code is the same on every carton that is represented in the range in MAN05/MAN06.

MAN03 and/or MAN06 are only used when sending a range(s) of ID numbers. When both MAN02/MAN03 and MAN05/MAN06 are used to send ranges of ID numbers, the integrity of the two ID numbers must be maintained.

When the shipping container is the same as the consumer unit, the U.P.C. may be the only UCC identification code on the container. In many applications, it is necessary to positively identify what identification code is to be scanned and matched at point of receipt. Since the U.P.C. is not a unique serial shipping container code, only one pack level for each item is required when using the pick and pack structure. The total number of shipping units for this item is the same as the quantity for the item in the SN1 segment at the item level.

This segment is required by Wal-Mart Stores, Inc.

 $SN1 \ \ \text{Item Detail (Shipment)}$ **Segment:**

0300 **Position:** Loop: HLLevel: Detail Usage: Optional Max Use:

Purpose:

To specify line-item detail relative to shipment

Syntax Notes: If either SN105 or SN106 is present, then the other is required. **Semantic Notes:**

SN101 is the ship notice line-item identification.

SN105 is quantity ordered. 2

Comments: SN103 defines the unit of measurement for both SN102 and SN104.

Notes: This segment is used to specify the quantities associated with the item identified in the LIN at the item level.

> When specifying an item, which is comprised of two or more components that are in unique shipping containers, SN103 will contain code ST for set and the quantity specified in SN102 is the number of sets as identified in the LIN segment. Each different component is identified in one pack level. See the VICS Note, on the SLN segment, at the pack level.

If SN103 contains "CA"-Cases, then the PO4 segment is required.

This segment is required by Wal-Mart Stores, Inc.

# ANSI X12 Introduction to the 856 Ship Notice/Manifest

This Draft Standard for Trial Use contains the format and establishes the data contents of the Ship Notice/Manifest Transaction Set (856) for use within the context of an Electronic Data Interchange (EDI) environment. The transaction set can be used to list the contents of a shipment of goods as well as additional information relating to the shipment, such as order information, product description, physical characteristics, type of packaging, marking, carrier information, and configuration of goods within the transportation equipment. The transaction set enables the sender to describe the contents and configuration of a shipment in various levels of detail and provides an ordered flexibility to convey information.

The sender of this transaction is the organization responsible for detailing and communicating the contents of a shipment, or shipments, to one or more receivers of the transaction set. The receiver of this transaction set can be any organization having an interest in the contents of a shipment or information about the contents of a shipment.

#### **Transaction Set Notes**

1. Number of line items (CTT01) is the accumulation of the number of HL segments. If used, hash total (CTT02) is the sum of the value of units shipped (SN102) for each SN1 segment.

## **Transaction Set Comments**

**1.** The HL segment is the only mandatory segment within the HL loop, and by itself, the HL segment has no meaning.

# VICS Introduction to the 856 Ship Notice/Manifest

The purpose of this section is to present and explain the application of the ASC X12 standards as they pertain to the retail industry implementation of the Ship Notice/Manifest Transaction Set. The use of this transaction is to provide the retailer with advance data on the shipments so the retailer may better plan workloads and receipt processing. The key word is "advance". Therefore, in the implementation of the transaction the latest the ship notice may be sent is the time of shipment. In practice the ship notice must arrive before the shipment. The scope of the ship notice, within the retail industry, will not exceed the scope of the associated bill of lading. There can be more than one ship notice with one bill of lading. The bill of lading is not applicable when using small package service carriers. In this case, the ship notice will only represent one ship from/ship to combination. The bill of lading is a legal shipping document which is the contract between the shipper and the carrier. The ship notice is not a legal document nor is it between shipper and carrier. The ship notice is not a replacement for the bill of lading.

There are two predominant methods of merchandise packaging within the retail industry. These are commonly known as:

- Pick and Pack where different SKUs are packed within the container,
- Standard Carton Pack where identical SKUs are packed within the container.

The retail industry has identified six hierarchical levels for use within the Ship Notice/Manifest transaction set. The following are the definitions of these levels:

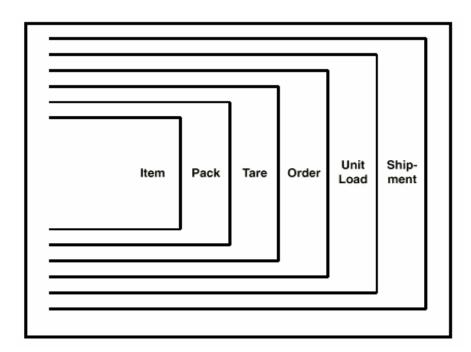

Name	Code	Description
SHIPMENT	S	Data that applies to the whole shipment, such as bill of lading number, lading quantity, supplier code, etc.
UNIT LOAD	UT	The Unit load level is used to identify a physical shipping unit which is marked with a UCC/EAN serial shipping container code, and, consists of transport packages marked for multiple final destinations.
ORDER	0	Data related to the sender's order and the associated receiver's original purchase order.
TARE	T	The tare level is used to identify pallets. These pallets are being shipped to a single final destination. If there are no identifiable pallets, this level may be omitted.
PACK	P	The pack level is used to identify the cartons, racks, bags, etc., in which the item is shipped, e.g. label serial numbers. In most cases there will be some sort of packs.
ITEM	I	SKU identification data. If identical SKUs are packed using unidentifiable inner packs, i.e. four six-packs to a case, this can be relayed at this level.

The retail industry implementation of the Ship Notice/Manifest transaction set supports both methods of merchandise shipment packaging with two distinct hierarchical structures. Each structure contains the same levels, i.e. Shipment, Unit Load, Order, Tare, Pack, and Item, and the

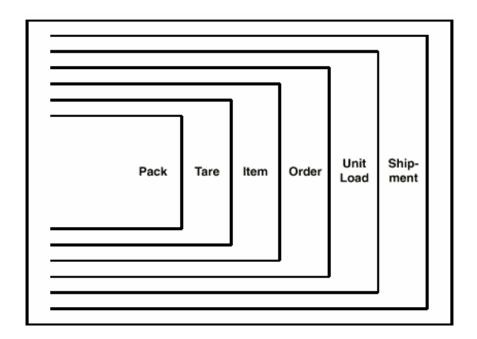

usage of the segments within each level are the same. The only difference is the order in which the levels may appear within the transaction set.

BSN05 informs the receiver, after reading the BSN segment, of the structure of the transaction set. The essential difference in the two structures is where the Item level appears. The actual structure for the ship notice transaction set is determined by the sender of the transaction set. Realizing, as with any transaction, that the needs of all the receivers and the capabilities of the sender's systems must be balanced when determining the final format. The relationship of a physical shipment to the shipment level of the transaction set is not always one to one. Some senders may have the capability of sending only one ship notice for each ship from/ship to combination. Other implementations may send multiple transactions for one bill of lading. An example of this would be where the ship notice transaction represents a sender's order level packing slip. Another variation of this is when a small package service carrier is used. The ship notice may have several cartons from one location with the same delivery location, however, from the package service carrier perspective, each carton is a shipment. It is important to recognize these conditions and not assume one ship notice, one physical shipment.

For the Pick and Pack Structure, the Item is the lowest level, i.e., the specification of the SKU is always within the shipment container. The order of the hierarchical levels are Shipment, Unit Load, Order, Tare, Pack, and Item.

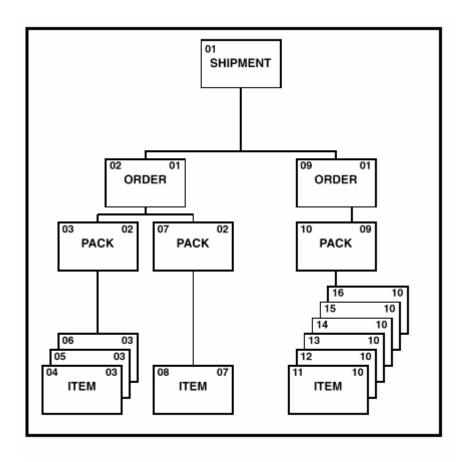

For the Standard Carton Pack Structure, the Item is between the Order level and the Tare level, i.e., the specification of the shipment containers is always within the SKU. The SKU is specified, then all of the shipping containers for the SKUs are identified. The order of the hierarchical levels are Shipment, Unit Load, Order, Item, Tare, and Pack.

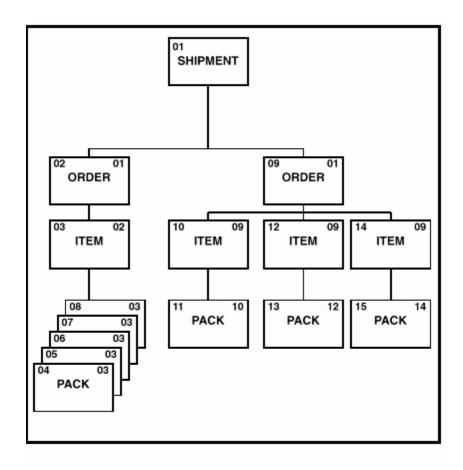

# **Pick and Pack Structure Example**

In this Pick and Pack Structure example, the shipment contains two orders. The first order has two cartons. The first carton contains three items (SKUs), the second carton contains one SKU. The second order contains one carton with 6 SKUs in the carton. Each box represents one hierarchical level (one HL segment followed by data segments). The number in each box (top left corner) is the hierarchical sequence number, (the number in HL01). The number in the top right is the parent ID (HL02).

# **Standard Carton Pack Structure Example**

In this example the shipment contains two orders. The first order has five cartons. All cartons contain the same SKU. The second order contains three cartons with a unique SKU in each carton. Each box represents one hierarchical level (one HL segment followed by data segments). The number in each box (top left corner) is the hierarchical sequence number, (the number in HL01). The number in the top right is the parent ID (HL02).

# Shipments via Small Package Service Carrier

Unlike other motor carriers, small package service carriers do not use the bill of lading for a shipment. In fact, the term shipment takes on a different meaning when using small package service carriers. The common, traditional, meaning of a shipment, in the context of the retail industry, is a supplier sending one or more shipping containers or transport packages to a single retailer's destination. This shipment may be one or more supplier orders and one or more retailer's purchase orders, or partial purchase orders. The shipment is under one bill of lading. The shipment may be represented by one or more than one 856 transaction.

To a small package service carrier, each transport package is one shipment. Each package is assigned a unique identification number by the carrier to facilitate the movement through their system. A manifest may be used by the shipper to list each package, destination, and other details; a bill of lading is not created. These manifests may be created at the end of the day or for each ship from/destination, or for each supplier order processed and shipped. The 856 transaction set should be used in the same manner as the supplier would use when sending under motor or common carrier. The use of a small package service carrier would not change this.

When a small package service provider is used, it may be useful to provide the carrier's assigned number as well as the UCC/EAN-128 Carton ID. It is not required to send both, however, it should be seriously considered to aid in tracking. This is especially true in a consumer catalog service or any direct ship to consumer (customer of retailer) using a small package service. It is desirable for the retailer to know each carrier assigned carton ID to track the shipment if the customer reports the ordered and billed merchandise was never received.

The MAN (Marks and Numbers) segment is used to send both package ID numbers. The TD5 segment at the shipment level will inform the receiver that a small package service provider is the carrier, by using the Standard Carrier Alpha Code (SCAC) and the Transportation Method/Type of Private Parcel Service.

## **Transaction Set Notes**

Number of line items (CTT01) is the accumulation of the number of HL segments. If used, hash total (CTT02) is the sum of the value of units shipped (SN102) for each SN1 segment.

## **Transaction Set Comments**

1. The HL segment is the only mandatory segment within the HL loop, and by itself, the HL segment has no meaning.

# **Conventions used in these guidelines**

- 1. Every data element on each segment is listed in the Data Element Summary section of the segment documentation, including unused Elements.
- 2. Every data element has the ANSI X12 data element ID noted.
- 3. Every data element has the ANSI X12 data element title noted.
- 4. Every data element has the ANSI X12 data element attributes noted:
  - 4.1. Data element requirement designation
    - 4.1.1. **Mandatory** (M) This element is required to appear in the segment.
    - 4.1.2. **Optional** (O) The appearance of this data element is at the option of the sending party or is based on the mutual agreement of the interchange parties.
    - 4.1.3. **Relational** (X) Relational conditions may exist between two or more data elements within a segment based on the presence or absence of one of those data elements. The relational condition is displayed under the heading "Syntax Notes."

#### 4.2. Data element type

- 4.2.1. **Numeric** (Nn) The numeric type of data element is symbolized by the two-position representation Nn. N indicates a numeric, and n indicates the decimal places to the right of a fixed, implied decimal point. the decimal point is not transmitted in the character stream. For negative values, the leading minus sign (-) is used. Absence of a sign indicates a positive value. The plus sign (+) should not be transmitted. Leading zeros should be suppressed unless necessary to satisfy a minimum length requirement. The length of the data element is the number of digits used. The minus sign (-) is not counted when determining the length of the data element value.
- 4.2.2. **Decimal Number** (R) The decimal type of data element is symbolized by the representation R. The decimal point is optional for integer values, but required for fractional values. For negative values, the leading minus sign (-) is used. Absence of a sign indicates a positive value. The plus sign (+) should not be transmitted. Leading zeros should be suppressed unless necessary to satisfy a minimum length requirement. The minus sign and the decimal point are not counted when determining the length of the data element value.
- 4.2.3. **Identifier** (ID) The identifier type of data element is symbolized by the representation ID. An identifier data element must always contain a value from a predefined list of values that is maintained by ASC X12 or other bodies that are recognized by ASC X12. The value is left justified. Trailing spaces should be suppressed.
- 4.2.4. **String** (AN) The string type of data element is symbolized by the representation AN. Contents of string type data elements are a sequence of any letters, digits, spaces, and/or special characters and contain at least one non-space character. The significant characters must be left justified. Leading spaces, if used, are assumed to be significant characters. Trailing spaces should be suppressed.
- 4.2.5. **Date** (DT) The date type of data element is symbolized by the representation DT. Format for the date type is CCYYMMDD. CC is the two digit Century (00-99). YY is the last two digits of the year (00-99), MM is the numeric value of the month (01-12), and DD is the numeric value of the day (01-31).
- 4.2.6. **Time** (TM) The time type is symbolized by the representation TM. Format for this type is expressed in 24-hour clock format, HHMMSSd..d. HH is the numeric expression of the hour (00-23), MM is the numeric expression of the minute (00-59), SS is the numeric expression of the second (00-59), and d..d is the numeric expression of decimal seconds.
- 4.3. Data element length (minimum/maximum)
- 5. Data elements utilized by Wal-Mart applications are noted in **bold** type.
- 6. Data elements ignored by Wal-Mart application are noted in *italicized type*.
- 7. Every data element utilized by Wal-Mart applications has the ANSI X12 data element purpose noted.
- 8. ID-type data elements have the list of utilized values noted.
- 9. VICS comments relating to segments and data elements are noted in bold text with a shaded background.
- 10. <u>Wal-Mart comments relating to segments and data elements are noted in underlined bold text with a shaded background.</u>

# **Example of Conventions**

Segment: N1 Name

Position: 0400 Loop: N1 Level: Heading Usage: Mandatory

Max Use: 1

**Purpose:** To identify a party by type of organization, name, and code

**Syntax Notes:** 1 At least one of N102 or N103 is required.

If either N103 or N104 is present, then the other is required.

**Semantic Notes:** 

**Comments:** 1 This segment, used alone, provides the most efficient method of providing organizational identification. To obtain this efficiency the "ID Code" (N104) must provide a key to the table maintained by the transaction processing party.

N105 and N106 further define the type of entity in N101.

Notes: There must be at least one occurrence of the N1 segment in the header area to ______9

identify the sender of the transaction in text or coded format.

Wal-Mart uses the data in this segment to determine where to route the Ship Notice

data so that receiving may be accomplished in an efficient manner. This is the

"ship-to" of the entire shipment.
